Biophys. Acta 1089:241-243(1991).

-1-FUNCTION: Collagen type III occurs in most soft connective tissues along with type I collagen.

-1-SUBUNIT: Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.

-1-FTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the
    the N-terminal domains of the murine

PTM: 0-linked glycan consists of a Glc-Gal disaccharide bound to the oxygen atom of a post-translationally added hydroxyl group (By

chains.

similarity).
SIMILARITY: Contains 1 VWFC domain.

-!- ENZYME REGULATION: Not inactivated by cyanide.
-!- ENZYME REGULATION: Not inactivated by cyanide.
-!- PATHWAY: Methanogenesis; first step.
-!- SUBUNIT: THIS ENZYME IS COMPOSED OF SEVEN SUBUNITS FWDA (65 kDa), FWDE (53 kDa), FWDC (31 kDa), FWDD (15 kDa), FWDE, FWDC.
-!- INDUCTION: By growth on tungsten or molybdenum under anaerobic

-!- FUNCTION: SEQUENCE-SPECIFIC TRANSCRIPTION FACTOR WHICH IS PART OF A DEVELOPMENTAL REGULATORY SYSTEM THAT PROVIDES CELLS WITH SPECIFIC POSITIONAL IDENTITIES ON THE ANYERIOR-POSIFERIOR AXIS.
BINDS TO THE DNA SEQUENCE 5'-AA[AT]TTTATTAC-3'.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- ALTERNATIVE PRODUCTS:
Event=Alternative splicing; Named isoforms=2;

activity within constitutive secretory pathways and capable of cleavage at the RX(K/R)R consensus motif (By similarity).
CATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Kaa-Yaa-Arg-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys. Releases albumin, complement component C3 and von Willebrand factor from their
                                                                                                        Expression
                                                                           respective precursors.

TISSUE SPECIFICITY: Transient expression in a subset of central nervous system neurons during embryonic stages 12-13. Expression in developing tracheal tree from stage 13 to end of embryonic
                                                                                                                                            DEVELOPMENTAL STAGE: Expressed both maternally and zygotically. SIMILARITY: Belongs to peptidase family S8. Furin subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROSITE; PS00156; SUBTILASE ASP; 1.

Xbb-, in which Xaa is preferably Leu, but may be other amino acids
including Pro although not Arg or Lys, and Xbb may be Pro.
-!- COFACTOR: Binds 2 manganese ions per subunit (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SUBLEARITY: Belongs to peptidase family M17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Woolwine S.C., Wozniak D.J.;
"Identification of an Escherichia coli pepA homolog and its
involvement in suppression of the algB phenotype in mucoid Pseudomonas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=20437337; PubMed=10984043;

"Coat protein of potyviruses. 5. Symptomatology, serology, and coat protein sequences of three strains of passionfruit woodiness virus.";

Arch. virol. 102:221-222(1988).

-1- PIM: The viral RNA of potyviruses is expressed as a single polyprotein which undergoes posttranslational proteolytic processing resulting in the production of at least eight individual proteins.

-1- SIMILARITY: Belongs to the potyviruses polyprotein family.

(WASH-) WASHINGTON RES FOUND.

Eyre DR;

WPI; 2001-146859/15.

Assay for detecting cross-linked telopeptide analytes indicative of type II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.

Disclosure; Page 15; 34pp; English.

The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of

```
The invention relates to a method of determining the rate of biosynthesis or breakdown of at least one inaccessible biological molecule in a subject. The method is useful for diagnosis or monitoring and treatment of diseases associated with an altered rate of biosynthesis/breakdown of an isotopically labelled precursor molecule, specifically osteoporosis; left-ventricular hypertrophy; liver cirrhosis or fibrosis; cardiac or lung fibrosis; Alzheimer's disease; multiple sclerosis; rheumatoid arthritis; diabetes mellitus; muscle-wasting syndromes; mescular dystrophy; athletic gene or protein targets, phenotypic/human validation studies on potential drugs, drug mechanism studies and determining the risk of developing the disease. The present sequence is human C-terminal telopeptide alpha 1. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; therapy; osteoporosis; left-ventricular hypertrophy; scleroderma; liver cirrhosis; congestive heart failure; multiple sclerosis; fibrosis; coal-miner's pneumoconiosis; muscle-waeting syndrome; diabetes mellitus; rheumatoid arthritis; Alzheimer's disease; muscular dystrophy; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining rate of biosynthesis or breakdown of inaccessible biological molecules, useful e.g. for diagnosis or monitoring treatment, by administering labeled precursor.
non-mineralized and mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of human collagen type III
                                                                                                                                                                 Gaps

The method is useful for diagnosis or monitoring and treatment of diseases associated with an altered rate of biosynthesis/breakdown of an isotopically labelled precursor molecule, specifically osteoporosis; left-ventricular hypertrophy; liver cirrhosis or fibrosis; congestive heart failure; scleroderma; coal-miner's pneumoconiosis; cardiac or lung fibrosis; Alzheimer's disease; multiple sclerosis; rheumatoid arthritis; diabetes mellitus; muscle-wasting syndromes; muscular dystrophy; athletic training and cancer. The method is also useful for screening candidate gene or protein targets, phenotypic/human validation studies on potential drugs mechanism studies and determining the risk of developing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining rate of biosynthesis or breakdown of inaccessible biological molecules, useful e.g. for diagnosis or monitoring treatment, by administering labeled precursor.
                                                                                                                                                                                                                                                                                        Human, therapy, osteoporosis, left-ventricular hypertrophy, scleroderma, liver cirrhosis, congestive heart failure; multiple sclerosis, fibrosis, coad-miner's pneumoconiosis, muscle-wasting syndrome, diabetes mellitus, rheumatoid arthritis, Alzheimer's disease; muscular dystrophy, cancer; collagen type I cross-linked carboxy-terminal peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disease. The present sequence is human collagen type I cross-linked carboxy terminal peptide (ICTP). This sequence is used to illustrate the

Diseases such as alcoholic cirrhosis, biliary cirrhosis, hepatitis, schistosomiasis, cardiac fibrosis, Crohn's disease, diabetic nephropathy and fibroses caused by surgery result from an inappropriate production of collagen fibrils. Collagen III is synthesised as a preproprotein which is modified by post-translation modification. The mature collagen III fibrils are generated by cleavage of a propeptide from the C-terminus followed by cleavage of a propeptide from the C-terminus corresponds to the procollagen III C-terminal propeptide (FIICP). As the fibrils are formed, the FIICP propeptide is released into the surrounding tissue fluids. The invention relates to an immunoassay to determine PIICP concentrations and thus diagnose the above diseases and others which result from inappropriate collagen deposition. Different fibrotic diseases may show different levels of FIICP in the serum so the

The new immunoassay may also be used to measure the rate of collagen synthesis in patients being treated with glucocorticosteroids. In addition the new antibodies may be used in immunohistochemical staining of cryostat and paraffin sections to assess collagen synthesis in tissue samples from patients suspected of having

The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by commence of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting domains) proteins. Also included are a polymetries of the complex, selecting a modulating compound in adipocyte colls, a recombinant host cell expressing at least one of the interacting colymeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polymeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), cells, in the specification (including its fragment or variant), a vector comprising the SID (RTM) polymoleotide, a recombinant host cell comprising the Vector, a protein chip comprising the polypeptides and compounds are useful for the complex, polypeptides, polymeleotides and compounds are useful for man of the complex of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the complex of the case of the case of the case of the complex of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polymucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID (RTW)) for screening drugs that modulate the protein interaction, thus exhibiting the therapeutic effect. The present sequence represents a SID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or lygases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of disoncers (e.g. cancer), immunodeficiency disorders (e.g. cancer), immunodeficiency disorders (e.g. ALDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AlDS) autoimmune disorders (e.g. arthritis), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophila), reproductive disorders (e.g. infertility) and infectious disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy, AMU22915-AMU23914 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but he was betained an electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polypeptides and polynucleotides useful for diagnosing, preventing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ovarian antigen, ovary disorder; breast disorder; neoplastic disorder; cancer; infectious disease; inflammatory disease; reproductive system disorder; autoimmune disorder; Alzheimer's disease; blood-related disorder; hyperproliferative disorder; hair loss; urinary system disorder; musculoskeletal system disorder; respiratory disorder; musculoskeletal system disorder; neural activity disorder; eucological disorder; endocrine disorder; gastrointestinal disorder; liver disorder; pancreatic disorder;

The invention relates to isolated ovarian related polypeptide (ovarian antigen) comprising a sequence at least 90% identical to a sequence selected from a polypeptide fragment, domain, epitope or full length protein of a sequence (51) appearing as ABG60239-ABG60266 having protein of a sequence (51) appearing as ABG60239-ABG60266 having condition in condition or species homologue of S1. Also included are the cDNA are useful for diagnosing, preventing, an anti-S1 antibody and the cDNA are useful for diagnosing, preventing, complastic disorders (such as ovarian Krukenberg tumour and cancer), infectious diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis, oophoritis), inflammatory diseases (e.g., mastitis), cardiovascular disorders (sickle cell anaemia), respiratory disorders (Alatheimer's disease and Parkinson's disease), arthritis, cardiovascular disorders (sickle cell anaemia), respiratory disorders (Alatheimer's diseases and Parkinson's disease), endocrine disorders (Alatheimer's diseases and Parkinson's disease), candevolopmental and inherited disorders, disorders (bilary liver cirrhosis), coperce transplantation or for supporting cell cost, or mintain organs (before transplantation or for supporting cell cost, organized and subjust to change a mammal's mental or physical state, and covarian antigen, SI protein of the printed specification, but was conditive and indectronic format directly from WIPO at frequence data for this patent did not format directly from WIPO at frequence data for condition in electronic format directly from WIPO at frequence data for conditions and cond

The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte colnA library. The proteins are designated SID (RTW) (selected interacting domains) proteins. Also included are a polymucleotide encoding a polypeptide in the adipocyte cells, a recombinant host cell expressing at least one of the interacting colypeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTW) polypeptide comprising any of the 738 amino acid cells, a SID (RTW) polypucleotide comprising ny of the 738 mucleotide sequences given in the specification (including its fragment or variant), a SID (RTM) polypucleotide comprising the vector, a protein including its fragment or variant), a vector comprising the vector, a protein chip comprising the polypeptides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is comprising the therapeutic effect. The present sequence represents a SID (RTW) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```

```
This sequence represents a chimeric procollagen molecule of the invention. This sequence has the procollagen C-prepropeptide from the pro-alphal(III) chain sequence. The C-alpha2(I) chain attended to the pro-alpha1(III) chain sequence. The C-propeptide is implicated in the assembly of the monomer chains into trimerised pro-alpha chains prior to cleavage of the N- and C-propeptides and formation of Collagen in fibril-forming pro-alpha chains. The C-propeptides determine the type-specific assembly of the moieties to which they are attached. The molecule of the invention comprises a first moiety, which is an alien collagen alpha-chain or a non-collagen material. The novel collagen molecule can be used for treatment or diagnosis in humans can expecially for the treatment of procollagen suicide, as an cabesive or implant, to promote (chronic) wound healing or fibroric diseases with reduced scarring or for use in photography, brewing, containing substitutions in the recognition site, may have significantly containing substitutions in the recognition site, may have significantly contain selection properties

This sequence represents a truncated procollagen pro-alphal(III) chain that can be used in the procollagen molecules of the invention. The C-propeptide is implicated in the assembly of the monomer chains into trimerised pro-alpha chains prior to cleavage of the N- and C-propeptides and formation of collagen in fibril-forming pro-alpha chains. The C-propeptides determine the type-specific assembly of the moietries to which they are attached. The molecule of the invention comprises a first moietry which is an allen collagen attached to a second moiety, which is an allen collagen abha-chain or a non-collagen material. The novel collagen molecule can be used for treatment or diagnosis in humans and seases with reduced scarring or for use in photography, brewing, codebuffs or textiles. The novel collagen so textiles are novel collagen molecules, especially when containing substitutions in the recognition site, may have significantly altered properties and characteristics, such as different binding the containing substitutions in the recognition as different binding the containing substitutions in the recognitions and different binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel pro:collagen mol. - comprising pro:collagen C-pro:peptide attached to an alien collagen alpha-chain or non-collagen material, useful e.g. for wound healing.
                                                                                                                C-propeptide; recognition sequence; procollagen; monomer chain; therapy; trimerised pro-alpha chain; fibril; procollagen suicide; wound healing; fibrotic disease; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     undifferentiated carcinoma; clear cell adenocarcinoma; cystadenofibroma;

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and mesavement of the expression of ovarian tumour marker genes (ABA83183-ABA83182, ABA83182, ABA831812, ABA83181, ABA83181 and ABA83183). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an epithelial ovarian tumour selected from excisous cystadenomar, borderline serous tumour, mucinous cystadenocarcinoma, borderline serous tumour, mucinous cystadenocarcinoma, clear cell adenocarcinoma, clear cell adenocarcinoma, clear of expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells relative to normal ovariant epithelial cells. The marker genes are information and in mucinous pathways, in the regulation of cell propolation and in mucinous pathways, in the regulation are membrane-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, ABB90745, They are useful for inhibiting tumour growth, neoangiogeneis in subjects bearing a vascularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthrits and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABL92075-ABL92141 and ABB90721-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL92042-041 and ABL92143-ABL92191; normal endothelial markers (NEM) ABL92042-ABL92074; and pan-endothelial markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                  Human; mouse; rat; TEM; tumour endothelial marker; NEM; PEM; cytostatic; normal endothelial marker; pan-endothelial marker; immunostimulant; antiangiogenic; tumour; neoangiogenesis; vascularised tumour; polycystic kidney disease; diabetes; retinopathy; rheumatoid arthritis; psotiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       An isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumor endothelial marker (TEM) protein, useful for inhibiting tumor growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

New purified human transmembrane protein, designated as tumor endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour Ecs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal polynocledid marker (PEM) and pan-endothelial marker (PEM) genes are identified in human ECs. The human EC marker proteins and the polynocleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoangiogenesis or tumour angiogenesis, for inducing an immune response to tumour endothelial cells in a patient, or for identifying candidate drugs for treating tumours. The present sequence represents a human TEM or NEM protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
